

ABSTRACT OF THE DISCLOSURE

A translation apparatus translates a translation target sentence in a source language into a translation sentence in a target language. Source words in sample sentences in the source language and a
5 translation word that represents translation of the corresponding source word in the target language are stored in correlated form. For a given translation target sentence, translation words that correspond to each word in the translation target sentence are extracted as translation candidate words from the stored contents. The translation words
10 extracted are displayed along with a specific word in the translation target sentence.
